

Subliminal Source Code

nungu (India)

nungu is a digital entity, located in the network - a human / a cyborg / a piece of codework / a mutating virus - with its own peculiar characteristics, whims, contradictions, ambitions.

viewsouce is nungu's resume, embedded in its html code. nungu's resume is a first person piece of code[`text`]work and details nungu's characteristics alongside those of its creators.

nungu is the interface, we [the authors] remain in the background, we are the source code.

[SURFACE]

nungu's entry/index pages are chosen at random from an ever expanding selection, by a script. they alert the user to the multiple identities of nungu.

clicking through the initial pages the user comes to the directory page in which all works are listed plus the prompt

```
'>>:;:>....;>:view.....:source;>>>:;:<:;>:'
```

[SUBLIMINAL]

as object oriented programming creates its object and defines its properties, when nungu's source code changes its interface mutates: different avatars, plays with identity, disguises - the real identity is underneath the inter[`sur`]face, at the source, the code.

even this identity is not static, yes static in appearance unlike the interface, but not static in its definition, it is an evolving manifesto, a mutating virus in the datascape.

as authors, identifying ourselves with the source code signals the desire to be a sovereign form media, to be underground and undetectable. as code we are free from visual surveillance at the level of data and yet directly participating in it.

the code does not partake in the spectacle but functions invisibly, performs subversively and avoids the transparent.
